

Contrastive ZipMix: compact three-seed mechanism screen

3 methods × 3 matched training seeds · 2,048 supervised answer-label tokens per run

○ Seed 0 □ Seed 1 △ Seed 2 ◆ Mean + 95% training-seed interval - - - Base checkpoint · evaluated once

Planned target contrasts · percentage points (pp), paired 95% intervals

Contrastive – Source-matched control: -1.73 pp [-10.63, +7.16]; raw p=1; Holm p=1

Contrastive – Shuffled contrast control: +0.07 pp [-4.16, +4.29]; raw p=1; Holm p=1

Holm adjustment covers the two planned target contrasts; retention is an unadjusted diagnostic.

Intervals: 95% Student-t across training seeds; evaluation items are held fixed. Intervals are not clipped.

Descriptive screening only. Three pairs cannot yield an exact two-sided sign-test p-value below 0.25.

This compact comparison does not establish broad generalization or state-of-the-art superiority.
